The barge's truss structure supported the Outline sound system along with lighting and video elements.

Floating Stage with Sound System Docks and Rocks at Ports of Call in Italy

GENOA, Italy — Show Technologies provided an Outline sound system to accompany a floating stage complete with lighting and video to entertain tourists and residents at various ports of call in Italy's seaside Liguria region this summer.

The setup, powered by Outline's T Series amps, included two L-R vertical hangs with 15 Mantas elements each and 12 DBS 18-2 twin 18-inch subwoofers under the stage (but above the waterline).

"We designed the sound system bearing in mind that it had to cover tourist ports with the public at a distance of between 50 and 150 meters from the points in which the barge was moored," said Show Technologies' Sacha Bozzo.

"When we arrived in Rapallo, we found that there was a distance of approximately 250 meters of sea between the rig and the first spectators. In spite of this, the sound reached the promenade loud and clear, which surprised even us!"
